

Rocket Track Glue 3X (RTG3X)

Rocket Track Glue is formulated to surpass the industry leading products by having used our 36 years of paint and coatings experience to bring science to the traction industry.

Our product has the ability to be cut with methanol or isopropyl alcohol up to **6 times** the amount of high volume solids. **One drum of our concentrate is comparable to 4 drums of the leading brand traction compound.**

What does this mean for you?

- Ability to custom formulate to your weather and track conditions to create that perfect track without applying massive amounts of product.
- Create your own spread rate and ratio that is customized to your type of cars being run traction for longer durations
- The high volume solids stay on the upper surface of the rubber layer allowing the rubber that day
- Save your on sight storage with ¼ the amount of space needed for your traction compound storage
- Dramatic shipping charge reduction with less filler and more solids being shipped directly to you
- No more unwanted and unusable empty drums sitting around the track
- Better adhesion and sustainability to the rubber on the track surface allowing superior surface to stay solid and not become porous, not allowing any moisture to get in between the rubber and track surface(concrete or asphalt)

Due to our high volume solids our product requires cutting/thinning before initial use and allows cutting even more to create your specific ratio. If you are accustomed to spraying 100% or reducing your traction compound by 50% the below chart represents suggested spread rate and cutting ratios.

Percentage	RTG 3X amount In gallons	IPA or methanol amount In gallons	Total amount In gallons
100%	1	3	4
40% reduction	1	3.6	4.6
50% reduction	1	5	6
60% reduction	1	5.4	6.4
